

Johnny's Summer Thyme

Summer Thyme is spicier and more pungent than other varieties. Grow as an annual in zones colder than 6. After the last frost in spring, transplant outside and space 6-8" apart, in rows at least 1' apart. Pinch off growing tips of upright growing varieties to make bushier plants.

Prefers sun/part shade. Thyme does best in light, dry, well-drained soil. Plants grow up to 12" tall. Space 6-8" apart. Cut only a few leaves the first year in order for the plants to winter over. In subsequent years, harvest just as the flowers being to open. Cut back to within 4-5" above the ground.
